

Calimax11: The new super insulating block with Poraver.

Block for block built safely for
the future

With the new Calimax11 super insulating block, Veit Dennert KG in co-operation with Poraver has developed a modular wall system which is giving traditional masonry an innovative push towards a reliable future.

Thanks to the Poraver light-weight aggregate, U values of up to $0.27 \text{ W/m}^2\text{K}^*$ are achieved. Any additional thermal-insulating measures on site are a thing of the past with this masonry. The vapour-diffusion properties, the noise-protection values and the load-bearing capacity have been enhanced to the maximum level possible. Optimum working characteristics are safeguarded with its particularly low weight and the exact fitting accuracy of the blocks.

Another benefit with Calimax11 is the sophisticated range of special blocks, with which all conventional external and wall thicknesses can be realised in a homogeneous wall structure largely without heat build-up.

*incl. plaster and render on the inside and outside

The ball that does it all
